

Fake WhatsApp Server — Testing Status & What's Left

Date: 21 Sep 2026

Scope: fake server (backend `comdove-fake-backend` + UI `comdove-fake-ui`)

Reference: the acceptance test = the **Demo Script** in the Hackathon PRD (§10)

This lists what has been tested and what testing is still left, so anyone can finish the run.

1. Already tested — working

#	Test	Result
1	Register a business number + create a group (Admin)	 works
2	Point wat-backend at the mock via env (no code change)	 works
3	Send from Comdove → customer: appears in tile, sent → delivered → read tracked	 works
4	Reply from a tile (customer → Comdove): reaches Comdove	 works
5	Live end-to-end vs the REAL wat-backend (both directions)	 works
6	Chat direction: customer's own messages on the right (WhatsApp-style, PRD §7)	 fixed + verified
7	Status behaviour: outbound has status, inbound has none (per FR-06/FR-07)	 correct by design
8	Session lock: a 2nd browser tab on an open group is refused	 works
9	Admin live log: every message with status + webhook result	 works
10	Reset: messages clear, numbers/groups remain	 works
11	Automated tests: backend 270 pass · UI 94 pass	 green

2. Testing still LEFT

These are Demo-Script steps not yet verified live end-to-end.

Step 4 — Offline queue

What: toggle a tile **offline** (grey dot) → send a message from Comdove to it → toggle **online** (green).

Expected: the message is **queued** while offline, then **arrives in order** when the tile comes online; delivered fires.

Why it matters: proves FR-05 (offline queue + flush).

Step 5 — Close & reopen a group

What: open a group, send 2–3 messages, **close the group tab**, then **reopen** it.

Expected: the tile's **full chat history** comes back **plus** anything queued while closed; late delivered/read fire on reconnect (visible in the admin log).

Why it matters: proves FR-17 + FR-18 (persistence + late statuses).

Step 8 — Keyword auto-reply

What: set a tile's auto-reply to **keyword** (e.g. "price" → "It is 500") via the gear, then send a matching message from Comdove.
Expected: the tile **auto-replies** on its own → a short bot conversation.
Why it matters: proves FR-10 (auto-reply).

Step 9 — Bad token error

What: send from Comdove using a **wrong token** (or force it).
Expected: the mock returns Meta's **error JSON (code 190)** and Comdove handles it (shows the failure).
Why it matters: proves FR-03 (real Meta error handling).

3. Known UI items to confirm (not blocking, but verify)

Item	Note
Tile chat display (+undefined / NaN:NaN)	Fixed on branch <code>fix/tile-chat-message-shape</code> — verify once merged
Chat direction (own = right)	Fixed + verified; confirm it stays after merge
Ticks in the tile	Not required by the PRD (status chips live in the Admin log); current tick placement follows Comdove's outbound status — confirm this is acceptable with the team
Production serving of the built UI	Dev proxies <code>/api</code> + <code>/ws</code> ; a built UI needs the mock to serve <code>client/dist</code> or a proxy — decision pending

4. How to run the remaining tests (quick)

Have running: mock (`:4020`), UI (`:5173` , `VITE_DATA_SOURCE=server`), and — for real-Comdove tests — wat-backend (`:3000` , local DB).

Offline queue (Step 4): in a tile, click the online dot to grey → send from Comdove (or `POST /api/inject` reversed) → click the dot green → watch it arrive.

Close/reopen (Step 5): send a few, click " ← Groups" (or close the tab), reopen the group → history + queued should appear.

Auto-reply (Step 8): tile gear → keyword mode → add "price → It is 500" → send "what is the price?" from Comdove.

Bad token (Step 9): send with a wrong bearer token to `POST /v23.0/{id}/messages` , or use the `X-Mock-Force-Error: 190` header.

5. Summary

Core is tested and working (send/receive both ways, direction, status, lock, reset, live vs real Comdove).
4 demo steps left to verify live: offline queue, close/reopen, auto-reply, bad-token error.
After those 4 tick, the **full PRD demo script (§10) is complete**.
